VR Graffiti

Why Learn Graffiti in VR?

Graffiti is a physical skill, not just a visual art.

Learning graffiti requires coordination between:

Movement

controlling hand trajectories and smooth strokes.

Distance & Speed

adjusting spray width, opacity, and consistency.

Lettering

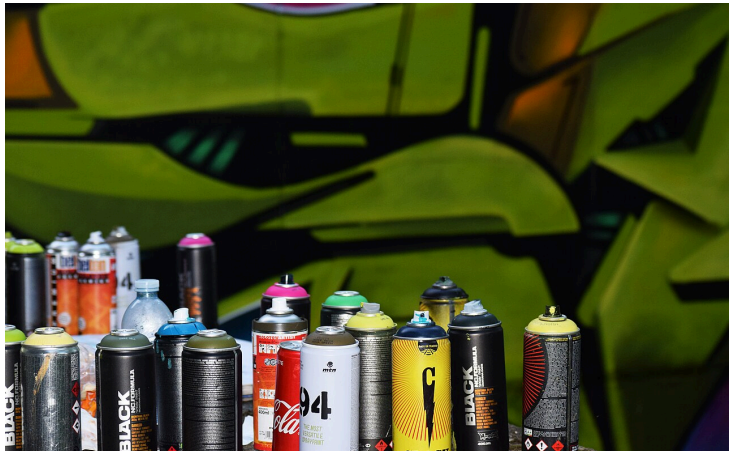

understanding letter structure, proportions, and styles.

The problem

Beginners face barriers to practicing consistently, including:

Limited access to appropriate spaces

Material costs

Safety considerations

The opportunity

VR can provide an accessible, repeatable environment for learning and experimenting with graffiti techniques.

Wall: Singlespeedfahrer. Cans: Chris Barbalis (CC0). Mask: Haragayato (CC BY-SA 3.0). Photos resized; cans cropped for display.

Graffiti combines artistic expression with embodied motor skills, but beginners rarely have access to structured, repeatable practice with feedback.

A quiet space to practice

Exposed concrete. Natural light. Room to focus.

Langen Foundation · Tadao Ando
Architectural reference

Practice wall

Watch, trace, then paint unaided.

Tool station

Choose a tool beside the wall.

Creative playground

Build your layout. Make your artwork.

Langen Foundation, photo: Till Niermann · CC BY 3.0. Photo cropped. Proposed VR layout described at right.

Three tools. Different control.

Spray, draw and fill.

Montana BLACK 400 ml

Spray can

Distance shapes the footprint

MTN Street Paint 15 mm

Paint marker

Contact gives a crisp edge

Purdy Mini Roller System

Paint roller

Broad passes build coverage

Controllers approximate motion; pressure, friction and weight are absent.

Product photos: Montana Cans product photography. MTN / Spray Planet product photography. Purdy product photography. Motion illustrations show proposed virtual behavior.

A first lesson: Bubble S

From guidance to independence.

Trace with spatial cues that gradually fade

Observe

See pose and pace.

Trace

Follow the motion trail.

Reproduce

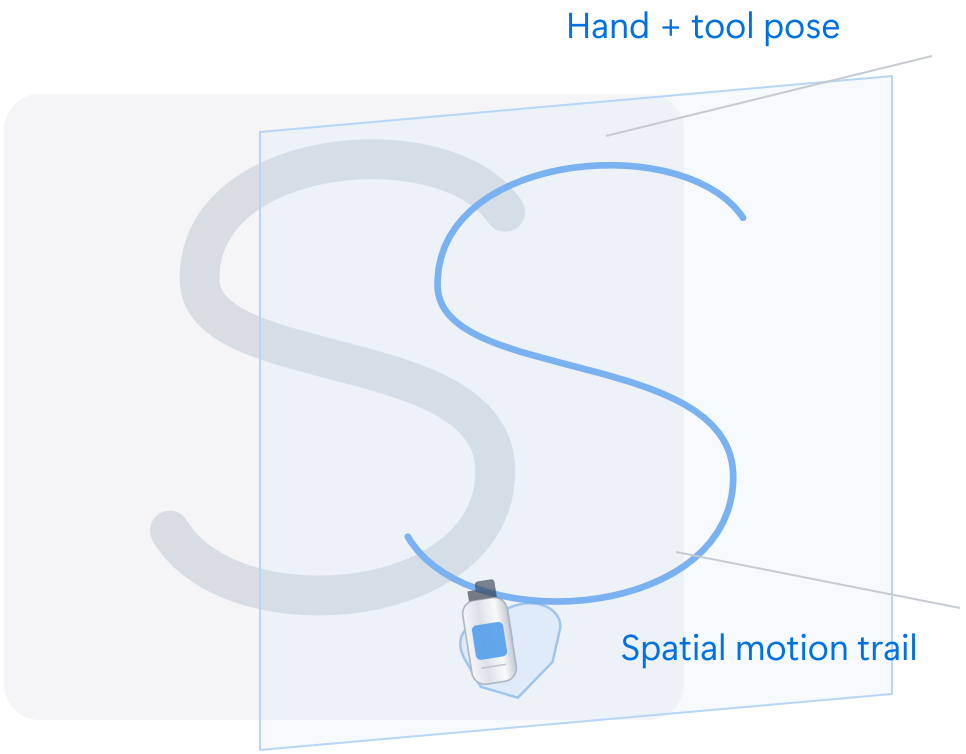

Paint without the overlay.

Remix

Make it your own.

Concept visualization. Support can be requested again. Remix has no single correct trajectory.

Guidance that steps back

Observational learning

See stroke order
and timing.

Scaffolding and fading

Full guide → faint trail
→ independent attempt.

Feedback and reflection

Distance cues during practice.
Path comparison afterward.

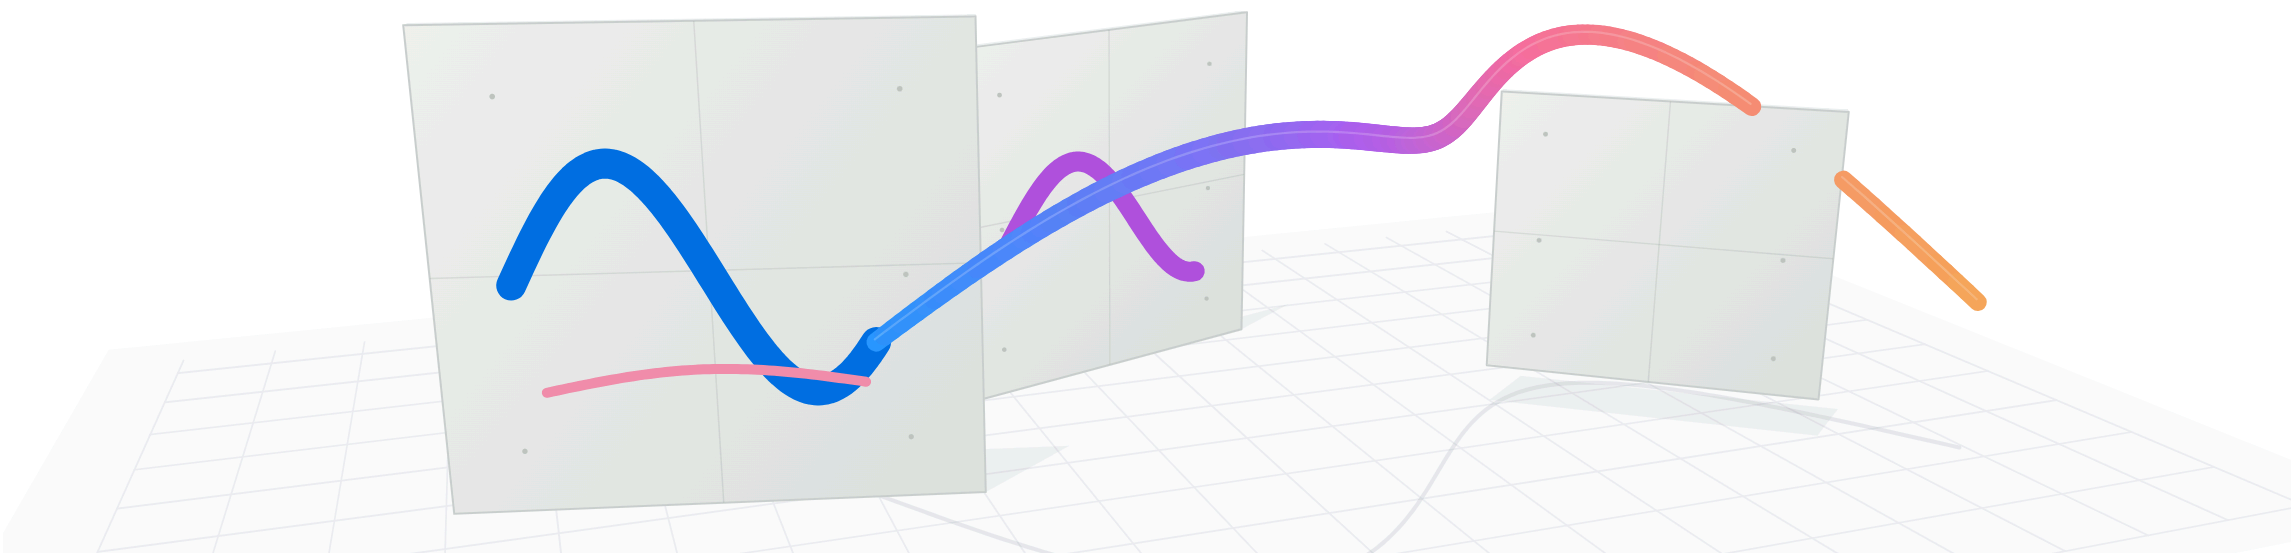

Embodied interaction

Move, paint and follow cues
in the same space.

Han et al., 2022. Wulf et al., 2010. Yu et al., CHI 2024. Levac et al., 2019. Design hypotheses, not established outcomes for this application.

Free Space to Practice

Shape your space. Create on your own terms.

Paint across surfaces and into open space

Create surfaces

Add walls of different sizes.

Arrange your space

Move and rotate your layout.

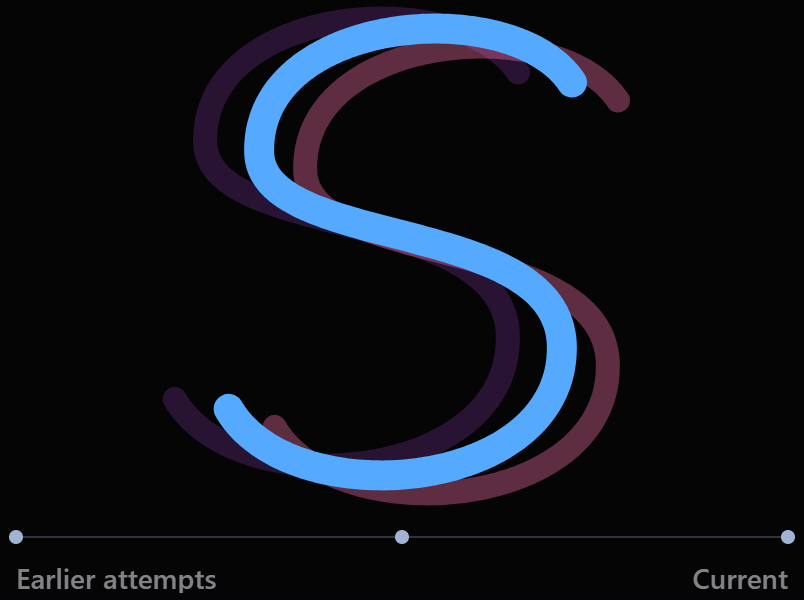

Go beyond walls

Extend your artwork into open space.

Concept animation: create surfaces, arrange the space, then paint across and beyond them.

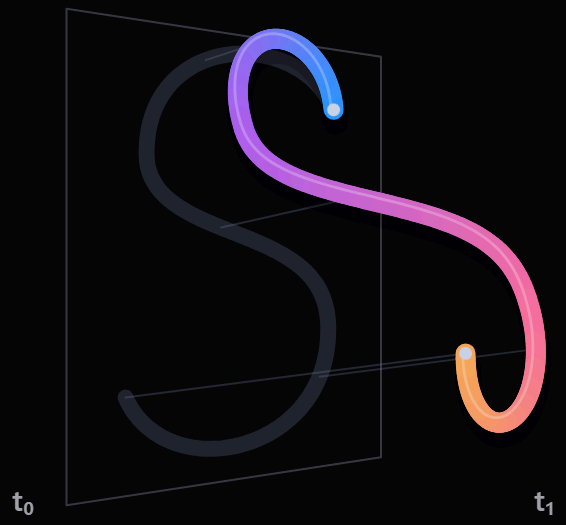

Beyond Traditional 3D Art

Create with time, motion and recorded gestures.

Temporal Layers

Past attempts.
One composition.

Time mapped to spatial depth

Time-to-Space

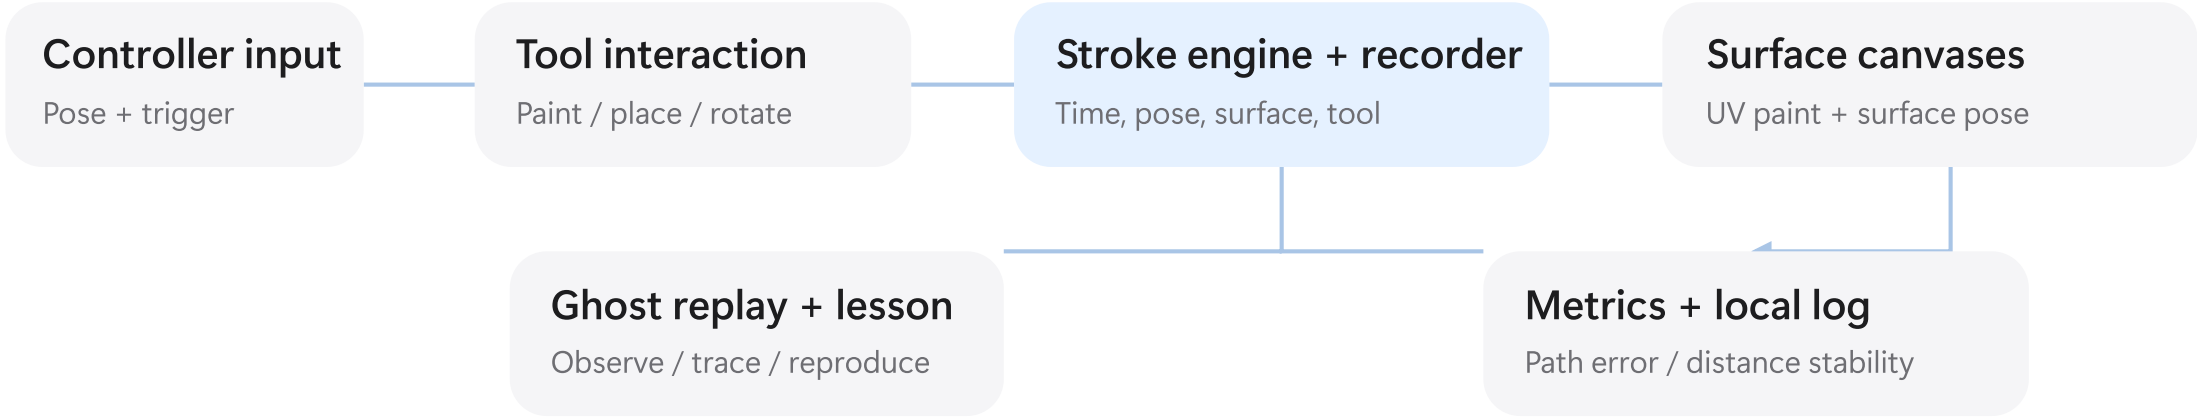

Time becomes depth.
The stroke leaves the wall.

Beyond the MVP. Both reuse recorded gestures.

Concept studies. Existing replay and spatial painting inform this temporal extension.

One recording. Several uses.

Meta Quest + controllers · Unity + C# · OpenXR + XR Interaction Toolkit

Paint + GPU cost

Profile brush stamps on Quest.
Cap history and lower resolution if needed.

Replay alignment

Use wall coordinates.
Calibrate height and reach.
Start with one plane.

Fidelity + scope

Visual distance feedback.
Protect one spray lesson.
Keep contact tools basic.

Unity, XR input options. Proposed local architecture. No backend, fluid simulation or fast hand-tracking dependency.

One lesson.
One semester.

Smart Chen · Solo developer

Experience: Unity XR, interaction, visual design and media.

Owns design, code, art direction, logging and evaluation.

Phase 1

Foundations

Quest input + studio.
Create + arrange walls.

Phase 2

Tools + lesson

Basic marker + roller.
Bubble S + lesson UI.

Phase 3

Guided practice

Record + replay.
Ghost trail + fading cues.

Phase 4

Test + polish

Unguided attempt + logs.
Usability + stable demo.

Semester MVP

Editable walls. Three tools. One S lesson.
Guided practice and free creation.

Stretch goals

Spatial painting. Temporal Layers.
Time-to-Space. Optional pilot.

Relative roadmap; dates follow the course deadline. Concept stage: no prototype or participant results.

Discussion

Questions for the next iteration

Why VR instead of a video?

Show tool motion at the wall.
Practice in the same space.

Will this transfer to real paint?

Unknown: controllers lack material feedback.
Physical transfer needs a separate test.

Why keep three tools?

Shared paint and recording systems.
Spray first; basic contact tools.

What if the plan is too large?

Protect the spray lesson and logging.
Defer the pilot and temporal art.

How will remix be assessed?

Reflection or artist feedback.
Path error measures copying.

What is the first thing to validate?

Can beginners follow the cues
while seeing their own mark?

Q&A backup. Physical transfer and comparative learning benefits remain untested.
